

## Jon Rappoport Provides More Evidence that Pollution Is Causing Illness that Is Blamed on the Coronavirus in China

March 3, 2020 | Jon Rappoport

Investigative journalist Jon Rappoport has previously reported on cases of the coronavirus that were “discovered” through misleading and worthless diagnostic tests. In this article, he quotes *The Lancet*, a British medical journal, that reported on a study that blamed air pollution levels for more than 400,000 premature deaths a year in China. The study also stated that “more than 100 million people live in cities where the air reaches levels considered ‘very dangerous’”. The article, written in 2005, stated that the Chinese government admitted that respiratory diseases were the leading cause of death in the country.

First, I want to mention 5G technology, which, according to reports, has been widely deployed in Wuhan, “the epicenter of the China epidemic.” Readers have sent me links to articles and videos that highlight human damage caused by 5G.

I’m aware of this damage. I’ve written about it before, and, I revisited it in a piece I wrote a few days ago titled [5G and the China epidemic](#). What is creating illness and death in China

is *not* an either-or situation. In my past research on epidemics, I've found *several causes* of disease in every “epidemic”—causes which have nothing to do with a virus.

In Wuhan, in addition to air pollution, we could certainly be looking at 5G, *and other situations of damage*—for example, water pollution, heavy chemical spraying.

I've also received communications asking about “all the other cases of the coronavirus” occurring in countries where air pollution is not a significant factor. To answer these questions, I urge reading all my articles on the so-called “China epidemic” ([archive here](#)). I've covered how “cases of the disease” are “discovered”—through entirely misleading and worthless diagnostic tests. It's always been easy to invent case numbers using these tests.

All right. A reader has sent me a significant piece published, in 2005, in the British medical journal, *The Lancet*. It emphasizes the destructive nature of air pollution in Chinese cities. Here are several excerpts.

The *Lancet*, November 19, 2005; **CHINA: THE AIR POLLUTION CAPITAL OF THE WORLD**, by Jonathan Watt:

“Over 400,000 premature deaths a year in China are blamed on air pollution levels...”

“According to the European Space Agency, Beijing and its neighbouring north-east Chinese provinces have the world's worst levels of nitrogen dioxide, which can cause fatal damage to the lungs.” [The so-called “coronavirus disease” is pneumonia.]

“At a recent seminar, Zhang Lijun, deputy director of the environmental protection agency, said that pollution levels could more than quadruple within 15 years unless the country slows the rise in energy consumption and car use.” [15 years later, it's a “coronavirus epidemic.” How convenient.]

“A recently published study, conducted by the Chinese Academy on Environmental Planning, found that a third of China's urban residents were exposed to harmful levels of pollution. More than 100 million people live in cities where the air reaches levels considered ‘very dangerous’.”

“The academy blamed air pollution for 411,000 [yearly] premature deaths—mostly from lung and heart-related diseases.”
